What is Surgical Sperm Retrieval (SSR)?

SSR is a technique for collecting sperm from a man's testicles. It is a minor procedure, carried out as a day case under heavy sedation.

Who needs SSR?

SSR is intended to help men who have no sperm in their ejaculate. This can be the result of a number of causes: a blockage in the vas deferens (the tube which carries the sperm to the penis); an absent vas deferens; or a blockage in the epididymis, (the structure connecting the testis to the vas deferens.) Most of these men produce healthy sperm in the testicles which can be retrieved by **SSR**. Unfortunately some men have testicles that fail to produce any sperm at all (this is called primary testicular failure) and **SSR** is not a suitable procedure for this condition.

Types of SSR

There are a few different types of **SSR** and the cause of the sperm problem will determine which procedure is most suitable for you:

PESA (Percutaneous Epididymal Sperm Aspiration)

PESA is a short, relatively painless procedure and requires no surgical incisions. A fine needle is inserted into the epididymis through the scrotum and fluid aspirated. This fluid is then inspected under a microscope for sperm count and motility. The procedure takes about 15-20 minutes.

TESA (Testicular Sperm Aspiration)

TESA is performed if no sperm are found in the epididymal fluid. This is a short, relatively painless procedure and requires no surgical incisions. A fine needle is inserted into the testes and tissue aspirated is then examined for sperm similar to **PESA** procedure.

TESE (Testicular Sperm Extraction) / Testicular Biopsy

TESE / Testicular biopsy is performed if no sperm are found in the **PESA** and **TESA** procedure. A small incision is made into the testis itself. A small sample of testicular tissue is taken which is examined for sperm. This procedure will cause some pain and tenderness, however full recovery is expected within a few days. A course of antibiotics is generally recommended. If necessary, tissue will be sent to histology laboratory to obtain full biopsy report.

Effectiveness of SSR

The sperm retrieved are used on the same day if it is a fresh cycle of **IVF / ICSI** or sperm can be frozen. The freezing process does not affect the ability of the sperm to subsequently fertilise an egg. However the

sperm retrieved are usually low in numbers, may not be mature and therefore cannot successfully fertilise an egg using standard **IVF** (In Vitro Fertilisation) technique. Because of this, the embryologist will pick out a single sperm to inject into each egg and this procedure is called **ICSI** (Intra Cytoplasmic Sperm Injection).

If non-motile sperm are all that are available for selection, it is impossible to tell whether the sperm are alive or dead, so fertilisation rates will be adversely affected. In some cases there may be no fertilization at all.

It is also possible that no sperm at all will be obtained.

What risks are involved?

SSR is a relatively low risk procedure. Possible complications include bruises, haematoma (collection of blood in testis), infection and anaesthetic risks.

Anaesthetic side effects include postoperative nausea and vomiting (usually last for 1-2 hours and can be controlled with medications), postoperative shivering, chest infection (very rare with sedation anaesthesia), awareness (becoming conscious during some part of operation; the majority of patients who are aware do not feel any pain, but may have memories of events in the operating theatre), allergic reaction to anaesthetic, very rarely anaphylaxis (risk is 1 in 10,000), risk of death or brain damage during anaesthesia (in general the risk is 1 in 100,000 but should be even rarer in sedation for minor procedures such as SSR

Prior to your procedure

- You will be required to complete consent forms for the procedure, storage and subsequent use of your sperm. This is usually done during your assisted conception clinic appointment.
- Please **DO NOT** eat and drink for at least 6 hours prior to the procedure.
- Chewing gum and smoking is to be strictly avoided.
- If you are on any regular medication, please let us know.
- Please call us on **0116 258 5922** a week before the procedure to confirm your presence on the allotted day of surgery.

After your procedure

- Please wear reasonably tight fitting underpants rather than boxer shorts after your procedure. This will provide some support to your scrotum.
- Showering is preferable to sitting in hot baths to prevent infection.
- Sexual activity is **NOT** advised for a week after the procedure.
- A follow up appointment in the clinic can be arranged prior to discharge with one of the consultant or nursing staff to discuss further management plan.
- If you have any doubts, please do not hesitate to contact Leicester Fertility Centre on **0116 258 5922**.

What follow-up care is available?

We understand that this is a very difficult time for you emotionally. Should you wish to access any supportive counselling regarding your treatment or your fertility you may contact the counsellors on 0116 258 5922.

Our commitment to patients

We are constantly striving to improve our services to patients and we will welcome your comments or suggestions for improvement.

Questions

If you have any questions write them down here to remind you what to ask when you speak to your consultant.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Today's research is tomorrow's care

We all benefit from research. Leicester's Hospitals is a research active Trust so you may find that research is happening when you visit the hospital or your clinic.

If you are interested in finding out how you can become involved in a clinical trial or to find out more about taking part in research, please speak to your clinician or GP.
